Diabetes Mellitus

Diabetes mellitus is a chronic condition in which the body has difficulty regulating blood glucose levels.

Common symptoms of diabetes include increased thirst, frequent urination, increased hunger, fatigue, blurred vision, slow wound healing, and unexplained weight loss.

Long-term complications can include nerve damage, kidney disease, eye disease, cardiovascular disease, and foot ulcers.

General management may include healthy eating, regular physical activity, blood glucose monitoring, medication, and insulin therapy when needed.

Hypertension

Hypertension, also called high blood pressure, occurs when the force of blood against artery walls remains too high over time.

Many people do not notice symptoms. Severe hypertension may cause headache, shortness of breath, chest pain, dizziness, or nosebleeds.

Risk factors include older age, family history, high salt intake, obesity, physical inactivity, smoking, alcohol use, and stress.

Management can include reducing salt intake, maintaining a healthy weight, exercising regularly, limiting alcohol, and taking prescribed medication.

Asthma

Asthma is a chronic inflammatory disease of the airways that can cause airway narrowing and mucus production.

Common symptoms include wheezing, coughing, chest tightness, and shortness of breath.

Triggers include pollen, dust mites, smoke, cold air, exercise, pet dander, respiratory infections, and strong odors.

Management may involve avoiding triggers, using inhalers correctly, following an asthma action plan, and seeking urgent care for severe symptoms.

Pneumonia

Pneumonia is an infection that inflames the air sacs in one or both lungs.

Symptoms may include cough, fever, chills, shortness of breath, chest pain, fatigue, and production of phlegm.

Risk is higher in young children, older adults, smokers, and people with weakened immune systems or chronic disease.

Treatment depends on the cause and severity. Medical evaluation is important because some cases need antibiotics or hospital care.

Anemia

Anemia is a condition in which the body does not have enough healthy red blood cells or hemoglobin to carry oxygen effectively.
